INTERNATIONAL PRELIMINARY
EXAMINATION REPORT

International application No. PCT/EP2003/011153

I. Basis of the report

1. With regard to the **elements** of the international application (*Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17):*

Description, Pages

1, 3, 4	as originally filed
2	received on 06.08.2005 with letter of 04.08.2005
2a	received on 06.01.2006 with letter of 06.01.2006

Claims, Numbers

1-5	received on 06.01.2006 with letter of 06.01.2006
-----	--

2. With regard to the **language**, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.

These elements were available or furnished to this Authority in the following language: , which is:

- ☐ the language of a translation furnished for the purposes of the international search (under Rule 23.1(b)).
- ☐ the language of publication of the international application (under Rule 48.3(b)).
- ☐ the language of a translation furnished for the purposes of international preliminary examination (under Rule 55.2 and/or 55.3).

3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.
- ☐ filed together with the international application in computer readable form.
- ☐ furnished subsequently to this Authority in written form.
- ☐ furnished subsequently to this Authority in computer readable form.
- ☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
- ☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

4. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
- ☐ the claims, Nos.:
- ☐ the drawings, sheets:

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)).

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT**

International application No. **PCT/EP2003/011153**

6. Additional observations, if necessary:

**V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability;
citations and explanations supporting such statement**

1. Statement

Novelty (N)	Yes: Claims	1-5
	No: Claims	
Inventive step (IS)	Yes: Claims	1-5
	No: Claims	
Industrial applicability (IA)	Yes: Claims	1-5
	No: Claims	

2. Citations and explanations

EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/EP2003/011153

DE 197 06 295 A1 describes a printing process, comprising the step of transferring two-dimensional colour printings with the help of a transferring pillow using ink type printing.

EP 1127 710 A1 discloses a method to transfer an ink image from one medium to a second medium at ambient temperature. Therein a digitized image is selected to be printed on an ink type printer.

EP 1 288 719 A2 and US 2003/0104308 A1 disclose an image forming material, an image formation method and a method for manufacturing a colour proof.

This document claims a layered material and a printing process in which a laser has the function to change the chemical properties of the layers contained in the claimed material.

EP 1 318 486 A1 discloses an apparatus for marking articles. It is mentioned that a common implementation of this invention is the creation of two-dimensional shapes and furthermore that the method may include at least one further printing step which is performed by rollers or cylinders under the use of special inks to enable invisible coding.

WO 01/53113 A1 discloses optically variable security devices. This security article comprises different optically active layers, coatings and an optical interference pattern. In this method lasers are used to scribe the diffraction patterns, which comprise a two-dimensional structure.

The method for the production of a stamping tool to stamp safety elements in surfaces of carrier material according to claim 1 differs from the disclosure of the cited prior art in that a 3-dimensional digitized template for the safety element is transferred to a stamping tool by laser means.

Although laser is known in the art to be used for printing and engraving surfaces, there is no disclosure or suggestion in the available citations that laser beams should be used to transfer a 3-dimensional digitised template on a stamping tool for stamping safety elements in surfaces of carrier materials, which can be used to create safety elements with a high definition structure that cannot be copied using common machine tools.

The subject matter of claim 1 is therefore novel and involves an inventive step.

10/574845
IAP9 Rec'd PCT/PTO 06 APR 2006

Claims

1. A method for the production of a stamping tool to stamp safety elements in surfaces of carrier material, comprising the following steps:
 - a) Creating a three-dimensional digitized template for the safety element, and
 - b) Transferring the digital data to the stamping tool via laser beams.
2. The method according to claim 1, characterized by the transfer being performed in a single-step process.
3. The method according to claim 1, characterized by the data for illustrating or design stamping being transferred to the stamping tool at the same time as the data for the safety element.
4. The method according to claim 1, characterized by the data for illustrating or design stamping being transferred to the stamping cylinder in a seamless and endless way.
5. The method according to claim 1, characterized by the stamping tool being composed of a pair of drums consisting of counter and matrix.

DE 197 06 295 A1 describes a printing process, comprising the step of transferring two-dimensional colour printings with the help of a transferring pillow using ink type printing.

EP 1 127 710 A1 discloses a method to transfer an ink image from one medium to a second medium at ambient temperature. Therein a digitized image is selected to be printed on an ink type printer.

EP 1 288 719 A2 and US 2003/0104308 A1 disclose an image forming material, an image formation method and a method for manufacturing a colour proof. This document claims a layered material and a printing process in which a laser has the function to change the chemical properties of the layers contained in the claimed material.

The method described in EP 1 318 486 A1 discloses an apparatus for marking articles. It is mentioned that a common implementation of this invention is the creation of two-dimensional shapes and furthermore that the method may include at least one further printing step which is performed by rollers or cylinders under the use of special inks to enable invisible coding.

The document WO 01/53113 A1 discloses optically variable security devices. This security article comprises different optically active layers, coatings and an optical interference pattern. In this method lasers are used to scribe the diffraction patterns, which comprise a two-dimensional structure.

exposure through a transparent film. During the following handling step the drum surface is removed at the exposed parts with etching medium. A further copy method transfers an existing structure, such as a level holographic structure, to the stamping tool via a stamping procedure. For these procedures, usually several manual activities are necessary, which results in high production costs, and sets limits to exact reproducibility. This also applies to mere manual methods such as copper and steel engraving, which, moreover, have long processing times.

< pages 2a, ... >

The objective of this present invention is to present a method of producing a stamping tool for the stamping of safety elements in surfaces of carrier materials, which can be used to create safety elements with a high definition structure that can not be copied using common machine tools.

This objective is solved with a method according to claim 1. Useful arrangements are the subject of the sub claims. A carrier material with a special safety element is defined in claim 1.

According to the invention, with a method to produce a stamping tool to stamp safety elements on surfaces of carrier materials, it is intended to initially create a three-dimensional digitized template for the safety element, and then to transfer the digital data onto the stamping tool. The template is created with the computer during all handling steps. By this, the template is not subject to an aging process and can be modified any time, even after many years. According to the invention technique, structures can be engraved in ranges of several nanometers. Compared to common methods, such as holography, also large areas can be processed herewith. Via controls, any geometry can be engraved into the structure of the surface. The digital data can be scaled at any discretion, which offers a cost-effective possibility to exactly match the safety element with the requirements. Because of the multitude of modification possibilities due to digital processing, hidden information can only be read out with the proper key.

The authenticity check is done with a special decoder to ensure key-lock technology. The information on the product can not be detected within the safety elements forming the lock. The information can only be made visible with the suitable key. If key and lock are distributed together on the product, a potential forger must also manufacture the key.
